(54) Title: PROTECTING GROUPS FOR CARBOHYDRATE SYNTHESIS

(I)

(II)

(57) Abstract

The invention provides collections of orthogonally-protected monosaccharides as universal building blocks for the synthesis of glycoconjugates of non-carbohydrate molecules, neo-glycoconjugates and oligosaccharides. This orthogonal protection strategy allows for the specific deprotection of any substituent on the saccharide ring, and greatly facilitates targeted or library-focused carbohydrate-related syntheses. In particular, the invention provides a universal monosaccharide building block of General Formula (I) or General Formula (II) in which A is a leaving group; X is hydrogen, O, N or N₃; X₁ is hydrogen, -CH₂O-, -CH₂NH-, -CH₃, -CH₂N₃ or -COO-; and B, C, D and E are protecting groups that can be cleaved orthogonally, and in which B, C, D and E are absent when X is hydrogen or N₃, and E is absent when X₁ is hydrogen, CH₃ or N₃.

PROTECTING GROUPS FOR CARBOHYDRATE SYNTHESIS

This invention relates to methods of synthesis of glycoconjugates, and in particular to orthogonally protected carbohydrate building blocks. The invention provides collections of orthogonally protected monosaccharides as universal building blocks for the synthesis of glycoconjugates of non-carbohydrate molecules, neo-glycoconjugates and oligosaccharides. This orthogonal protection strategy allows for the specific deprotection of any substituent on the saccharide ring, and greatly facilitates targeted or library-focused carbohydrate related syntheses.

BACKGROUND OF THE INVENTION

Oligosaccharides are important components of a variety of different types of biological molecules, and are involved in antigenic recognition and cell-cell interactions. In many cases, bio-molecules require conjugation with a carbohydrate component in order to be fully functional. In order to enable investigation of the biological function, and to exploit the exquisite biochemical and antigenic specificity of oligosaccharides, it is essential to have access to highly defined, specific synthetic oligosaccharides. Therefore achieving efficient, cost-effective synthesis of oligosaccharides and glycoconjugates by either solution or solid phase methods is of the utmost importance.

This task is enormously complicated by the complexity of oligosaccharides. Because of the number of sites which can carry substituents, and the number of possible ways in which two saccharide molecules can be linked, the number of permutations is enormously high.

In naturally-occurring oligosaccharides D-glucose, D-galactose L-fucose, D-mannose, D-glucosamine and D-galactosamine are among the most common sugar residues. To construct oligosaccharides and carbohydrate conjugates

using these sugars, current methodologies require long, protracted syntheses, involving synthesis of as many as one hundred different specially-protected sugar donors in order to cover adequately all the possible permutations of glycosidic link formation (eg. 1-3, 1-4), link type (eg. α or β) and to include all possible branching points in the oligosaccharide.

Orthogonal protection of bi-functional molecules has been a widely used technique in organic chemistry, which provided general building blocks for selected syntheses. However, orthogonal protection in the case of molecules with a greater degree of functionalisation is quite rare. Our technology involves penta-functional monosaccharide building blocks, which require a much higher level of chemical specificity to attain the appropriate orthogonality.

Orthogonal protection has been defined by Merrifield as follows:

"The principle of orthogonal stability requires that only those protecting functions should be used that can be cleaved under different reaction conditions without affecting the other functions present"
(Merrifield, 1977)

Although the use of orthogonal protection would greatly facilitate carbohydrate related synthesis, there has been limited success in devising suitable protecting groups and methods.

Wong et al. synthesised a universal building block with chloroacetyl, *p*-methoxybenzyl, levulinyl and *tert*-butyldiphenylsilyl protecting groups, selectively removable with sodium bicarbonate, trifluoroacetic acid, hydrazine and hydrogen fluoride-pyridine respectively, on a galactopyranose ring with an aryl-thio leaving group at the glycosidic position. This building block was used solely to synthesise a 6-hexanate glycoside. The subsequent recombinant oligosaccharide library formation focused on using the 6-hexanate derivatised building block which

exhibits only four degrees of orthogonality (Wong et al, 1998).

Similarly Kunz and coworkers synthesised an orthogonally protected D-glucopyranose derivative, but synthetic manipulations were only performed on the aglycon. These authors describe orthogonal protection of hydroxyl groups on a monosaccharide linked at C1 via a thioglycoside group to a solid support or to a succinimide moiety. In this case the protecting groups are acetyl or methyl at C2, allyl at C3, ethoxyethyl at C4, and tert-butyldiphenylsilyl at C6. The thioglycoside anchor functionalized in the side-chain is stated to be crucial. Again there is no suggestion that this protection system can be used for substituted sugars. Kunz's orthogonally-protected building block was not used for glycosylation or construction of glycoconjugates or neo-glycoconjugates, by directly attaching functionalities to the pyranose ring (Wunberg et al. 1998).

In our earlier International Patent Applications No. PCT/AU97/00544, No. PCT/AU98/00131 and No. PCT/AU98/00808, we described protecting and linking groups which enabled oligosaccharides and aminooligosaccharides to be synthesised using solid phase methods of the type which for many years have been used in peptide synthesis. In addition the protecting groups, described therein were useful for solution-phase synthesis. The entire disclosures of these specifications are incorporated herein by this reference.

We have now devised new types of building blocks which greatly facilitate the synthesis of oligosaccharides and glycoconjugates, using orthogonally-protected saccharide building blocks with five degrees of orthogonality. These building blocks contain a leaving group or latent leaving group at the glycosidic position, and another four orthogonally-protected functional groups around the carbohydrate ring.

- 4 -

Using our approach with six universal building blocks based on six of the most common naturally occurring sugars, any one of the one hundred sugars referred to above may be quickly synthesised in a facile manner, using simple, well-known protecting group chemistry. The years of work and complex protection strategies required to produce these one hundred building blocks by previously-available methods can be avoided by use of our six universal building blocks, which do not require a high level of skill to use, and enable one to achieve the synthesis of a specific desired oligosaccharide or glycoconjugate much faster and more efficiently than previously possible.

SUMMARY OF THE INVENTION

In its most general aspect the invention provides a universal monosaccharide building block of General Formula I or General Formula II

I

II

in which

A is a leaving group, including but not limited to groups such as SR ; where R is alkyl, substituted alkyl, alkenyl, substituted alkenyl, alkynyl, substituted alkynyl, cycloalkyl, substituted cycloalkyl, aryl, substituted aryl, halogen; trichloroacetimidoyl-; sulphoxide; -O-alkenyl;

X is hydrogen, O, N or N_3 ;

X_1 is hydrogen, $-\text{CH}_2\text{O}-$, $-\text{CH}_2\text{NH}-$, $-\text{CH}_3$, $-\text{CH}_2\text{N}_3$ or $-\text{COO}-$; and

B, C, D and E are any protecting groups which can be cleaved orthogonally.

- 5 -

It will be appreciated that as a consequence of stoichiometry and valence bond theory B, C, D and E are absent when X is hydrogen or N₃ and E is absent when X₁ is hydrogen, CH₃ or N₃.

5 The following non-limiting sets have been designated as orthogonal to each other on the basis of their cleavage conditions. A protecting group is classified in a particular set according to its lability to the cleavage conditions for a particular set and its
10 stability to the cleavage conditions required for the removal of those groups in the remaining sets. Each set is to be taken to include, but is not be limited, by the members thereof.

 Of the sets defined, set 1, the 'Base Solvolysis' set, is of particular importance, because in addition to
15 the fact that the members of this set are considered to be orthogonal to the members of the remaining sets, some members of this set are also considered to be orthogonal to each other. Where this is the case, the alternative
20 condition of cleavage that provides orthogonality is specified in brackets following the listing of the protecting group.

III

- 8 -

in which

A, X and X_1 are as defined for General Formulae I and II, and

5 B_1 , C_1 , D_1 and E_1 are orthogonal carbohydrate protecting groups (ie. an orthogonal set) selected from protecting group sets 1, 2, 6 and 8.

Another preferred embodiment provides a compound of General Formula IV

10

in which

15 A, X and X_1 are as defined for General Formulae I and II, and

20 B_2 , C_2 , D_2 and E_2 are selected from the members of protecting group set 1, and in themselves constitute an orthogonal set, for example the carbohydrate-protecting groups levanoyl (ammonia-labile), chloroacetate (thiourea-labile), *p*-methoxybenzyloxycarbonyl (oxidation-labile) and 2-trimethylsilylethylcarbonate (fluoride ion-labile).

This embodiment provides universal building blocks with protecting groups selected from the protecting groups of set 1.

25 In a third preferred embodiment the invention provides a compound of General Formula V

- 9 -

in which

A, X and X_1 are as defined for General Formula I and II, and

5 B_1 , C_1 , D_1 and E_1 are an orthogonal set of protecting groups selected from amongst the members of set 1 and from the remaining orthogonal sets.

10 This embodiment provides orthogonally protected building blocks, the protecting group constituents of which may be selected from within set 1 and from the remaining sets.

15 It will be clearly understood that the invention is not limited to use with monosaccharides, but is also applicable to any compound in which substituents are linked to a pyranose or furanose ring, such as sugar analogues.

 For the purposes of this specification it will be clearly understood that the word "comprising" means "including but not limited to", and that the word "comprises" has a corresponding meaning.

20 For the purposes of this specification "orthogonal cleavage" is defined as the regioselective cleavage of a hydroxy or amino protecting group from a carbohydrate, in which the cleavage conditions do not compromise the stability of the other protecting or
25 functional groups on the molecule. Such cleavages can be effected in any order of priority. "Cleaved orthogonally" and "orthogonal cleavage" are taken to be synonymous.

The invention provides universal building blocks, which are useful in the solution and solid phase synthesis of oligosaccharides. The reaction scheme for synthesis of each target molecule is designed so as to specify the orthogonally-protected functional groups which must be freed for glycosylation, and those which need to be capped with a protecting group such as benzyl, benzoyl, or another such group which remains uncleaved until the end of the synthesis, in order to avoid competition during glycosylations later in the synthesis.

- 11 -

When participation during the glycosylation reaction is required, the 2-hydroxyl is selectively deprotected and re-protected with a benzoyl group which, again, remains until the completion of the synthesis. In the case of 2-deoxy 2-aminosugars, if participation or stereoselectivity is required the Dde group might be removed and replaced with a tetrachlorophthaloyl or 2,5-dimethylpyrrole group.

10 **Example 1 Synthesis of an Exemplary Tetrasaccharide**

A strategy for synthesis of the tetrasaccharide of formula VI is set out in Scheme 1.

VI

- 13 -

In solution phase, protecting groups A and C from the first sugar residue of the target molecule (residue [4]) are selectively removed, and the sites capped by a permanent protecting group, eg. benzoyl group. The residue is then coupled to the resin, followed by selective removal of protecting group B. In solution phase, protecting group A from sugar residue [3] is selectively removed, and the site is capped by a permanent protecting group. Residue [3] is then linked to the resin-bound sugar residue via a glycosylation reaction. Protecting group C from the new disaccharide is removed, and residue [2] is linked via a glycosylation. Protecting group A is finally selectively removed to regenerate the 6-hydroxyl group, which is linked with residue 1.

The residue was purified by chromatography using EtOAc - hexane 1 : 4 as the mobile phase to give methyl 2-azido-6-O-tert-butylidiphenylsilyl-2-deoxy-3-O-(4-methoxybenzyl)-1-thio- β -D-glucopyranoside (**10**) (2.1 g, 91%)

Methyl 2-azido-4-O-benzyl-6-O-tert-butylidiphenylsilyl-2-deoxy-3-O-(4-methoxybenzyl)-1-thio- β -D-glucopyranoside (32**)**

A suspension of sodium hydride (196 mg, 5.1 mmol) in dry DMF (10 mL) was cooled to 0 °C, and a solution of methyl 2-azido-6-O-tert-butylidiphenylsilyl-2-deoxy-3-O-(4-methoxybenzyl)-1-thio- β -D-glucopyranoside (**10**) (2.53 g, 4.3 mmol) in dry DMF (20 mL) was added dropwise in 30 minutes. The resulting solution was stirred at room temperature for 30 minutes and benzyl bromide (880 mg, 5.1 mmol) was added dropwise at 0 °C. The reaction mixture was stirred at room temperature overnight, cooled to 0 °C and dry methanol (1 mL) was added dropwise. The reaction mixture was concentrated under reduced pressure, then xylene (20 mL) was co-evaporated from the residue. The residue was taken up in CHCl₃ (100 mL) washed with H₂O (100 mL), saturated NaHCO₃ solution (100 mL) dried over MgSO₄ and evaporated to dryness. The residue was purified by chromatography using EtOAc - Hexane 1 : 9 as the mobile phase to give methyl 2-azido-4-O-benzyl-6-O-tert-butylidiphenylsilyl-2-deoxy-3-O-(4-methoxybenzyl)-1-thio- β -D-glucopyranoside (**32**) (2.0 g, 68%).

Methyl 2-azido-4-O-benzyl-2-deoxy-3-O-(4-methoxybenzyl)-1-thio- β -D-glucopyranoside (33**)**

To a mixture of methyl 2-azido-4-O-benzyl-6-O-tert-butylidiphenylsilyl-2-deoxy-3-O-(4-methoxybenzyl)-1-thio- β -D-glucopyranoside (**32**) (1.5 g, 2.2 mmol) and anhydrous AcOH (28.8 mL) in dry THF (169 mL) hydrogen fluoride-pyridine complex (20.3 mL) was added in a polypropylene container. The reaction mixture was kept at room temperature

- 35 -

overnight, then diluted with EtOAc (1 L). The resulting solution was washed with saturated sodium hydrogen carbonate (4 x 1 L), saturated brine solution (1 L), dried over MgSO₄ and evaporated to dryness. The residue was
5 crystallized from MeOH. The mother liquor was evaporated, the residue was treated with hexane to get more solid. The solid products were combined affording methyl 2-azido-4-O-benzyl-2-deoxy-3-O-(4-methoxybenzyl)-1-thio- β -D-glucopyranoside (33) (735 mg, 75%).

10

Methyl 2-azido-4-O-benzyl-6-O-(4-chlorobenzyl)-2-deoxy-3-O-(4-methoxybenzyl)-1-thio- β -D-glucopyranoside (34)

A suspension of sodium hydride (71 mg, 1.8 mmol) in dry DMF (5 mL) was cooled to 0 °C, and a solution of methyl 2-
15 azido-4-O-benzyl-2-deoxy-3-O-(4-methoxybenzyl)-1-thio- β -D-glucopyranoside (33) (680 mg, 1.5 mmol) in dry DMF (5 mL) was added dropwise in 30 minutes. The resulting solution was stirred at room temperature for 30 minutes and 4-chlorobenzyl chloride (295 mg, 1.5 mmol) was added dropwise
20 at 0 °C. The reaction mixture was stirred at room temperature for 4.5 hours, cooled to 0 °C and dry methanol (1 mL) was added dropwise. The reaction mixture was concentrated under reduced pressure, then xylene (10 mL) was co-evaporated from the residue. The residue was treated
25 with hexane (10 mL) and filtered to give methyl 2-azido-4-O-benzyl-6-O-(4-chlorobenzyl)-2-deoxy-3-O-(4-methoxybenzyl)-1-thio- β -D-glucopyranoside (34) (620 mg, 71 %).

30

Methyl 2-azido-4-O-benzyl-6-O-(4-chlorobenzyl)-2-deoxy-1-thio- β -D-glucopyranoside (35)

A mixture of methyl 2-azido-4-O-benzyl-6-O-(4-chlorobenzyl)-2-deoxy-3-O-(4-methoxybenzyl)-1-thio- β -D-glucopyranoside (34) (580 mg, 1.01 mmol) and DDQ (270 mg,
35 1.2 mmol) in CH₂Cl₂ - H₂O 9:1 (10 mL) was stirred at room temperature for 3 hours. The reaction mixture was washed with saturated NaHCO₃ solution (3 x 15 ml), dried over

- 36 -

MgSO₄ and evaporated. The residue was purified by chromatography using CHCl₃-Hexane-MeOH 30:20:0.5 as the mobile phase to give methyl 2-azido-4-O-benzyl-6-O-(4-chlorobenzyl)-2-deoxy-1-thio- β -D-glucopyranoside (35) (300 mg, 66%).

Methyl 2-azido-4-O-benzyl-6-O-(4-chlorobenzyl)-2-deoxy-3-O-pentamethylbenzyl-1-thio- β -D-glucopyranoside (36)

A suspension of sodium hydride (40 mg, 1.0 mmol, 60%) in dry DMF (5 mL) was cooled to 0 °C, and a solution of methyl 2-azido-4-O-benzyl-6-O-(4-chlorobenzyl)-2-deoxy-1-thio- β -D-glucopyranoside (35) (280 mg, 0.67 mmol) in dry DMF (5 mL) was added dropwise in 30 minutes. The resulting solution was stirred at room temperature for 30 minutes and pentamethylbenzyl chloride (200 mg, 1.0 mmol) was added dropwise at 0 °C. The reaction mixture was stirred at room temperature for 4 hours, cooled to 0 °C and dry methanol (1 mL) was added dropwise. The reaction mixture was concentrated under reduced pressure then xylene (10 mL) was co-evaporated from the residue. The residue was in EtOAc (100 mL), washed with brine (2 x 100 mL), dried over MgSO₄ and evaporated. The resulting solid was suspended in hexane (50 mL) and filtered to give methyl 2-azido-4-O-benzyl-6-O-(4-chlorobenzyl)-2-deoxy-3-O-pentamethylbenzyl-1-thio- β -D-glucopyranoside (36) (290 mg, 76%).

2-[(1,3-dimethyl-2,4,6(1H,3H,5H)-trioxypyrimidin-5-ylidene)methylamino]-ethyl 2-azido-4-O-benzyl-6-O-(4-chlorobenzyl)-2-deoxy-3-O-pentamethylbenzyl- α,β -D-glucopyranoside (37)

A mixture of methyl 2-azido-4-O-benzyl-6-O-(4-chlorobenzyl)-2-deoxy-3-O-pentamethylbenzyl-1-thio- β -D-glucopyranoside (36) (220 mg, 0.36 mmol), 2-[(1,3-dimethyl-2,4,6(1H,3H,5H)-trioxypyrimidin-5-ylidene)methylamino]-ethanol (150 mg, 0.66 mmol), molecular sieves 4A (1 g) and DMTST (138 mg, 0.66 mmol) in 1,2-dichloroethane (10 mL) was stirred at room temperature for 30 minutes. The reaction

- 37 -

mixture was neutralized with TEA (0.5 mL) and evaporated. The residue was purified by chromatography using CHCl₃-MeOH 40 mL : 20 drops as the mobile phase to give 2-[(1,3-dimethyl-2,4,6(1H,3H,5H)-trioxopyrimidin-5-ylidene)methylamino]-ethyl 2-azido-4-O-benzyl-6-O-(4-chlorobenzyl)-2-deoxy-3-O-pentamethylbenzyl-β-D glucopyranoside (37) (220 mg, 77%).

2-[(1,3-dimethyl-2,4,6(1H,3H,5H)-trioxopyrimidin-5-ylidene)methylamino]-ethyl 2-amino-4-O-benzyl-6-O-(4-chlorobenzyl)-2-deoxy-3-O-pentamethylbenzyl-α,β-D glucopyranoside (38)

A mixture of 2-[(1,3-dimethyl-2,4,6(1H,3H,5H)-trioxopyrimidin-5-ylidene)methylamino]-ethyl 2-azido-4-O-benzyl-6-O-(4-chlorobenzyl)-2-deoxy-3-O-pentamethylbenzyl-β-D glucopyranoside (37) (160 mg, 0.2 mmol) and TEA (3 drops) in 1,3-propanedithiol (1 mL) was stirred at room temperature overnight. The reaction mixture was chromatographed using EtOAc - hexane 1:1 then EtOAc - MeOH 10:1 solvent systems as mobile phases to give 2-[(1,3-dimethyl-2,4,6(1H,3H,5H)-trioxopyrimidin-5-ylidene)methylamino]-ethyl 2-amino-4-O-benzyl-6-O-(4-chlorobenzyl)-2-deoxy-3-O-pentamethylbenzyl-α,β-D glucopyranoside (38) (123 mg, 80%)

2-[(1,3-dimethyl-2,4,6(1H,3H,5H)-trioxopyrimidin-5-ylidene)methylamino]-ethyl 2-[(1,3-dimethyl-2,4,6(1H,3H,5H)-trioxopyrimidin-5-ylidene)methylamino]-4-O-benzyl-6-O-(4-chlorobenzyl)-2-deoxy-3-O-pentamethylbenzyl-α,β-D glucopyranoside (39)

A mixture of 2-[(1,3-dimethyl-2,4,6(1H,3H,5H)-trioxopyrimidin-5-ylidene)methylamino]-ethyl 2-amino-4-O-benzyl-6-O-(4-chlorobenzyl)-2-deoxy-3-O-pentamethylbenzyl-β-D glucopyranoside (38) (50 mg, 0.066 mmol), 1,3-dimethyl-5-[(dimethylamino)methylene]2,4,6(1H,3H,5H)-trioxopyrimidine (Wow-reagent) (50 mg, 0.24 mmol), TEA (0.2 mL) in CHCl₃ - MeOH 3:1 (4 mL) was stirred at room

- 38 -

temperature for 3 hours. The reaction mixture was evaporated, the resulting residue was chromatographed using EtOAc as the mobile phase to give 2-[(1,3-dimethyl-2,4,6(1H,3H,5H)-trioxypyrimidin-5-ylidene)methylamino]-ethyl 2-[(1,3-dimethyl-2,4,6(1H,3H,5H)-trioxypyrimidin-5-ylidene)methylamino]-4-O-benzyl-6-O-(4-chlorobenzyl)-2-deoxy-3-O-pentamethylbenzyl- α,β -D glucopyranoside (39) (45 mg, 75%).

Example 8 Selective deprotection study using an Orthogonally Protected Thioglycoside Building Block, Methyl 2-azido-6-O-tert-butylidiphenylsilyl-4-O-biphenylcarbonyl-2-deoxy-3-O-(4-methoxybenzyl)-1-thio- β -D glucopyranoside (11)

Methyl 2-azido-6-O-tert-butylidiphenylsilyl-2-deoxy-3-O-(4-methoxybenzyl)-1-thio- β -D glucopyranoside (10)

Sodium (89 mg) was reacted in dry MeOH (50 mL) then a solution of methyl 2-azido-4-O-biphenylcarbonyl-6-O-tert-butylidiphenylsilyl-2-deoxy-3-O-(4-methoxybenzyl)-1-thio- β -D

CLAIMS

1. A universal monosaccharide building block of General Formula I or General Formula II

5

in which

- 10 A is a leaving group;
 X is hydrogen, O, N or N₃;
 X₁ is hydrogen, -CH₂O-, -CH₂NH-, -CH₃, -CH₂N₃ or
 -COO-; and
 B, C, D and E are protecting groups which can be
 cleaved orthogonally,
 15 and in which
 B, C, D and E are absent when X is hydrogen or
 N₃, and E is absent when X₁ is hydrogen, CH₃ or N₃.

2. A monosaccharide building block according to
 20 claim 1, in which A is selected from the group consisting
 of -SR; where R is alkyl, substituted alkyl, alkenyl,
 substituted alkenyl, alkynyl, substituted alkynyl,
 cycloalkyl, substituted cycloalkyl, aryl, substituted aryl,
 halogen; trichloroacetimidoyl-; sulphoxide; and -O-
 25 alkenyl.

3. A monosaccharide building block according to
 claim 1 or claim 2, which is a compound of General Formula
 III

30

- 44 -

III

in which

B₁, C₁, D₁ and E₁ are orthogonal carbohydrate
 5 protecting groups selected from protecting group sets 1, 2,
 6 and 8 as herein defined.

4. A monosaccharide building block according to
 claim 1 or claim 2, which is a compound of General Formula
 10 IV

IV

15 in which

B₂, C₂, D₂ and E₂ are selected from the members of
 protecting group set 1, and in themselves constitute an
 orthogonal set.

20 5. A monosaccharide building block according to
 claim 4, in which the members of protecting group set 1 are
 levanoyl, chloroacetate, p-methoxybenzyloxycarbonyl and 2-
 trimethylsilylethylcarbonate.

25 6. A monosaccharide building block according to
 claim 1 or claim 2, which is a compound of General Formula
 V

- 45 -

in which

A, X and X_1 are as defined for General Formula I
 5 and II, and

B_1 , C_1 , D_1 and E_1 are an orthogonal set of
 protecting groups selected from amongst the members of set
 1 and from the remaining orthogonal sets.

10 7. A method of synthesis of a molecule selected from
 the group consisting of glycoconjugates of non-carbohydrate
 molecules, neo-glycoconjugates and oligosaccharides,
 comprising the step of using a monosaccharide building
 block according to any one of claims 1 to 6.

15

8. A method according to claim 7, in which the
 molecule comprises one or more compounds in which
 substituents are linked to a pyranose or furanose ring.

20 9. A method according to claim 7 or claim 8, in
 which the molecule comprises a sugar analogue.

10. A method according to any one of claims 7 to 9,
 in which the synthesis is carried out in solution.

25

11. A method according to any one of claims 7 to 9,
 in which the synthesis is carried out on a solid-phase
 support.

Box I Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos :
because they relate to subject matter not required to be searched by this Authority, namely:
2. ☒ Claims Nos : 1-4, 6-11
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
These claims are so broad in scope that a search could not be carried out on economic grounds. See supplemental sheet.
3. ☐ Claims Nos :
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a)

Box II Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

Supplemental Box

(To be used when the space in any of Boxes I to VIII is not sufficient)

Continuation of Box No: 1.2

No meaningful international search can be carried out on claims 1-4, 6-11 as they are so broad in scope. Indeed a relatively narrow substructure search of "A" being "-SMe" resulted in several hundreds of compounds falling within the scope of these claims. Accordingly this search report has been limited largely to the invention defined by claim 2 and the examples.

NB: the citations are only a selection of many citations that fall within the scope of the claims.
